Scientists can upload their metadata to make their data findable and accessible even if it was a data publication or if it is an unpublished data set. Furthermore, the GIN[6] data hosting service (RRID:SCR\_015864) provides an opt-in feature to automatically update the metadata service when changes to a dataset occur, to ensure the metadata is always up-to-date.

Finally with a metadata resource service the G-Node hosts a platform providing terminologies and templates for metadata annotation. It presents a forum for general feedback, usage discussions and exchange of metadata templates with the scientific community.
